TERMIS as an engineering tool

Jesper Thvilum, the owner of the company Thvilum Tegnestue ApS in the town of Odder near Århus in Denmark, has expressed his satisfaction with the TERMIS software.

He comments: "Since 1995 we have used the LicHeat software – the precursor of TERMIS – to perform calculations for several district heating plants. Today we use TERMIS, which makes the job of creating calculation models easy and fast. This is a great advantage for us as consultants as well as for district energy plants."

"Another feature is the transfer of data from the plant's billing system to a consumer database connected directly to TERMIS. This is what makes it so easy to create new areas with future consumers and include them in the calculations. "I would especially like to emphasize the graphical interface in the software. It makes it possible – with every calculation - to get a quick overview of for example the pressure distribution in the network", Jesper Thvilum adds.
